Netting Specialists Share World Class Innovations

Ennio International, Australia's leading netting & innovative casing specialists continue with its new innovations strategy to bring new designs and products of a world class standard to their valued Australian customers.

One of the benefits of Ennio's continuing international activity is the new technology that they bring back and develop into new products designed to keep their customers abreast of industry movements on the world stage. This includes speciality products such as coloured casings, new elastic netting patterns, new applications for current products and the most recent exciting technological advance, Nutrafilm™, the new direction of edible casings for the future.

Nutrafilm™ is the superior alternative to collagen film, an edible carageenan film made from water soluble polysaccharides (sea weed based). Extremely user friendly, this new film provides great product yields, minimal wastage, good indentation and is plant based, not animal based so eliminates consumer concerns about cross-contamination of species.

Ennio remains unique in providing specialist netting and casing solutions to the industry, with over two decades of experience, their wide range of products for every application and their conduit to world class technology enabling their customers to produce quality products which set them apart from their competitors.
